

DEATHCON Solar

"Play in your world. Die in ours."

"Two scientists trying to stop a solar superstorm from melting the Antarctic ice cap are chased down as eco-terrorists by U.S. and Chinese special forces."

Who: The whole family. The whole world. United in fear for our little green world.

What: An action thriller set in an exotic landscape, right here on planet Earth.

When: We missed a solar superstorm catastrophe by only nine hours in 2012. These things come every 25 years. Are. We. Ready?

Why: A solar superstorm (a gigantic solar mega-flare of geomagnetic energy) has never been featured on the silver screen. What happens when this monster energy vortex punches through the Ozone Hole (the ozone layer blocks out most of the U.V. energy elsewhere) with enough thermal flux to melt the whole Antarctic ice cap? Noah's Flood 2.0 is what happens: oceans rising by 200 feet worldwide – overnight.

How: The Carrington Event hit northern Europe in 1859, knocking out lights and sparking fires in London. Another superstorm hit Quebec Province in Canada in 1989, causing similar damage. A direct hit now would obliterate all electronics, knocking the planet back to the stone age for decades.

Yawn: Boring! Like we haven't seen a thousand disaster flicks, much less with all the human disasters in the news. That's where the penguins come in. Fun, fuzzy, adorable little tykes who steal your heart from the beginning. Antarctica is their world, and a solar superstorm will obliterate it – for all 20 million penguins. *"Think of penguins as little people,"* WACO says.

Sad fact: We're already destroying the penguin's beautiful world. Eighty percent of the carbon dioxide from global warming is absorbed in the cold Antarctic depths, acidifying the oceans worldwide. Soon twenty percent of the world's protein supply will be destroyed by acidifying oceans – and nobody even knows the clear and present danger.

Subtext: The two villains represent China and the U.S., the leading contributors to climate change. They look that much worse when the bar for "hero" is represented by INEZ, a lady Russian researcher (albeit a dissident, or so she says), and WACO a sociopath penguin scientist.

Diversity: I'm a 100% disabled veteran, and consulting engineer. I've published two textbooks on energy conservation with McGraw-Hill, age 66.
